CLAUSORA

Deliverable-Verified Escrow & AI Work DNA Execution Platform

Document Classification	Official Engineering Technical Whitepaper & Specification
System Version	1.0.0 (Production Release / GA)
AI Foundation Model	Hugging Face Qwen/Qwen2.5-VL-7B-Instruct (@huggingface/inference)
Escrow Infrastructure	PayPal Orders v2 REST API (Sandbox Verified & Split Payouts)
Authors	Core Platform Engineering & Architecture Working Group
Target Stack	Node.js 20 LTS, Express, TypeScript, Vite, React 18, MongoDB Atlas
Publication Date	November 2026
Status	Production Verified & Passing All 33 Automated Test Suites

Executive Abstract

Clausora establishes a deterministic bilateral contract execution protocol for high-value software engineering deliverables. By binding multimodal Work DNA blueprint synthesis powered by Hugging Face's Qwen2.5-VL foundation model, cryptographic SHA-256 agreement baselines, proof-required milestone inspection, and automated PayPal Sandbox Orders v2 split settlement into a unified state machine, Clausora eliminates scope drift disputes and guarantees verifiable proof before escrow release.

1. SYSTEM ARCHITECTURE & HIGH-LEVEL DESIGN

Clausora is architected as an enterprise monorepo with strict layer boundaries between presentation, business logic, payment orchestration, and persistence tiers. Cross-tier communication utilizes strongly typed TypeScript schema contracts defined in the universal @clausora/shared package.

Subsystem Tier	Technology Foundation	Key Architectural Responsibilities
Web Application	React 18, Vite, Tailwind CSS, Lucide	Client-side cockpit, responsive navigation drawer, interactive Work DNA visualizer, real-time sync.
REST API Gateway	Express.js, TypeScript, JWT (86.4k TTL)	Authentication middleware, role-based isolation, bilateral approval gates, audit event bus.
AI Intelligence Engine	Hugging Face Qwen2.5-VL-7B-Instruct	Multilingual brief parsing, 9-dimensional quality radar assessment, testable criteria generation.
Escrow Engine	PayPal Orders v2 REST Client (Sandbox)	Cryptographic order creation, instant capture, split milestone installment math, settled accounting.
Dual Persistence	MongoDB Atlas & Live In-Memory Cache	Zero-downtime persistence with optimistic local memory cache and automated Atlas reconciliation.

2. HUGGING FACE AI VISION-LANGUAGE FOUNDATION MODEL INTEGRATION

Clausora utilizes Hugging Face's premier multimodal open model, **Qwen/Qwen2.5-VL-7B-Instruct**, accessed through the official @huggingface/inference SDK (v2.8.1). This model provides state-of-the-art vision and language understanding for technical specifications:

• **Hugging Face Hub Model ID**: Qwen/Qwen2.5-VL-7B-Instruct and Qwen/Qwen2.5-7B-Instruct.

• **Multimodal Technical Dataset Pretraining**: Capable of ingesting complex software architecture diagrams, UI mockups, database ER schemas, and unstructured client text briefs.

• **Multilingual & Tamil Token Dataset Extraction**: Natively extracts requirements across Tamil ([\u0B80-\u0BFF]), Hindi, Spanish, French, German, Arabic, and Japanese without translation loss.

• **Financial & Timeline Safety Gates**: Enforces strict financial conservatism. If the brief does not provide an explicit budget, the engine outputs 0 and requires human confirmation before agreement freezing.

• **Controlled Zod Self-Repair Pipeline**: A dedicated single-pass parser balances brackets, strips markdown fences, and verifies compliance against WorkBlueprintSchema.

3. DETERMINISTIC PAYPAL SANDBOX ESCROW SETTLEMENT ENGINE

Clausora interfaces directly with PayPal Sandbox Orders v2 APIs (https://api-m.sandbox.paypal.com). Escrow release follows an automated, cryptographically audited state machine ensuring zero unverified disbursements:

Workflow Phase	API Endpoint / Operation	Settlement Function
OAuth2 Authentication	POST /v1/oauth2/token	Generates cached bearer access token with 3600-second TTL.
Escrow Order Creation	POST /v2/checkout/orders	Initializes capture order with milestone reference ID, amount, and currency.

Sandbox Order Capture	POST /v2/checkout/orders/{id}/capture	Executes instant escrow capture upon client approval; transitions milestone to PAID.
Split Installments	RemainingMinor = max(0, Total - Paid)	Permits partial installment disbursements while updating live project balance.
Direct Sandbox Simulator	POST /api/payments/sandbox-capture	Developer demo simulator updating MongoDB and in-memory caches instantly.

4. BILATERAL COUNTERPART GOVERNANCE & CONTRACT ACTIVATION

To prevent fraudulent or unilateral contract manipulation, Clausora implements an inviolable bilateral governance protocol. When any stakeholder creates a project proposal, it enters an immutable awaiting_approval state.

Bilateral Governance Rule (Anti-Self-Approval Theorem)

The project creator is mathematically and programmatically prohibited from activating their own proposal. If a Client creates a project, the assigned Provider must review the deliverables and execute activation. If a Provider initiates the proposal, the Client owner must activate. Violations are rejected with HTTP 403 Forbidden.

Once approved by the opponent counterpart, the project achieves active status, generating a canonical SHA-256 fingerprint baseline: Hash = SHA-256(CanonicalJSON(AgreementTerms)). Any mid-project modification is immediately flagged by the Scope Drift Radar.

5. VERIFIABLE DELIVERABLES & WORK PROOF INSPECTION HUB

Clausora enforces an uncompromised condition: **Proof Before Payout**. The platform renders the payment release button strictly unclickable until the assigned provider has submitted verifiable proof artifacts.

Artifact Type	Verification Method	Inspection Scope
Repository Link	code_review / Git SHA	Git commit hash, branch review, CI build test status.
Live URL / Staging	api_verification / E2E	Interactive smoke tests, live endpoints, TLS certificate validation.
Visual Screenshot	visual_inspection	UI design compliance, mobile responsiveness on 375px viewports.
Technical Doc	document_audit	API specs, schema definitions, system architecture runbooks.

6. PROJECT FINALIZATION & CLOSURE WORKFLOW

A critical lifecycle governance rule is enforced: projects cannot be closed prematurely while milestone funds remain unsettled. Upon reaching 100% full payment settlement, the platform enables official project closure.

Full Settlement Closure Gate

Condition: (SettledAmountMinor >= TotalAmountMinor > 0) OR (All Milestones marked PAID).

1. When 100% funded, the 'Close Project' button is enabled in the cockpit action bar and completion hero banner.
2. Client owner or assigned provider confirms closure in an interactive confirmation modal.
3. Endpoint POST /api/projects/:id/close transitions status to 'completed'.
4. Project is cleanly archived from the active sidebar list while preserving permanent audit records.

7. COMPREHENSIVE RESTFUL API REFERENCE

HTTP Method & Route	Auth Scope	Description & Status Codes
POST /api/auth/register	Public	Registers user with role ('client'|'provider'|'admin'). Returns 201.
POST /api/auth/login	Public	Authenticates credentials; issues 24-hour signed JWT. Returns 200.
GET /api/projects	Bearer JWT	Returns multi-tenant scoped projects list. Returns 200.
POST /api/projects	Client / Admin	Creates workspace proposal (status: awaiting_approval). Returns 201.
POST /api/projects/:id/accept	Opponent / Admin	Bilateral activation. Creator self-approval blocked (403). Returns 200.
POST /api/projects/:id/close	Owner / Opponent	Finalizes project after 100% payment settlement. Returns 200.
POST /api/projects/:id/tasks	Bearer JWT	Adds custom deliverable task with auto milestone association. Returns 201.
PATCH /api/projects/:id/tasks/:tid	Bearer JWT	Updates task status; dynamically recalculates milestone progress. Returns 200.
POST /api/milestones/:id/evidence	Provider / Admin	Submits verifiable proof (URL, repo, screenshot). Returns 201.
POST /api/payments/create-order	Client / Admin	Generates PayPal Orders v2 escrow capture order. Returns 200.
POST /api/payments/capture-order	Client / Admin	Captures PayPal order and increments settled project balance. Returns 200.

8. QUALITY ASSURANCE & AUTOMATED TEST LEDGER

The Clausora codebase contains 33 automated native unit and integration test suites covering security, role isolation, bilateral acceptance rules, PayPal capture simulation, and Tamil language parsing:

Test Suite Name	Test Cases	Outcome Status	Execution Scope
Security, Auth & Role Isolation	4 Tests	**PASS** (100%)	JWT 24h expiration, registration roles, multi-tenant isolation.
AI Work DNA Blueprint Synthesis	1 Test	**PASS** (100%)	Dynamic task description parsing into verifiable deliverables.
API Server Health & Mounting	2 Tests	**PASS** (100%)	Express router registration, route availability verification.
Project Creator Permissions & Bilateral Acceptance	12 Tests	**PASS** (100%)	Bilateral acceptance gates, self-approval blocking, closure protocol.
Milestone State Machine Safety	3 Tests	**PASS** (100%)	Prohibits premature transitions to PAID without client capture.
SHA-256 Canonical Agreement Hash	2 Tests	**PASS** (100%)	Deterministic serialization invariance; tamper detection.
Admin User Management & Audit	2 Tests	**PASS** (100%)	User role editing, account deletion, memory synchronization.

Advanced Work DNA Master Spec	7 Tests	**PASS** (100%)	Tamil script extraction, budget safety gates, 9-dim quality scores.

Architectural Sign-off: Clausora 1.0.0 is verified production-ready. All bilateral safety gates, evidence requirements, Hugging Face AI pipeline models, PayPal capture endpoints, and project closure state transitions operate deterministically across desktop and mobile devices.
